

5.1V +8V REGULATOR WITH DISABLE AND RESET

ADVANCE DATA

- OUTPUT CURRENTS UP TO 0.75A
- FIXED PRECISION OUTPUT 1 VOLTAGE
5.1V ± 2%
- FIXED PRECISION OUTPUT 2 VOLTAGE
8V ± 2%
- OUTPUT 1 WITH RESET FACILITY
- OUTPUT 2 WITH DISABLE BY TTL INPUT
- SHORT CIRCUIT PROTECTION AT BOTH
OUTPUTS
- THERMAL PROTECTION
- LOW DROP OUTPUT VOLTAGE

DESCRIPTION

The TDA8133 is a monolithic dual positive voltage regulator designed to provide fixed precision output voltages of 5.1V and 8V at currents up to 0.75A.

An internal reset circuit generates a reset pulse when the output 1 decrease below the regulated voltage value.

Output 2 can be disabled by TTL input.

Short circuit and thermal protections are included in all the versions.

CIRCUIT DESCRIPTION

The TDA8133 is a dual voltage regulator with Reset and Disable.

The two regulation parts are supplied from one voltage reference circuit trimmed by zener zap during EWS test.

Since the supply voltage of this last is connected at Pin 1 (V_{IN1}), the regulator 2 will not work if Pin 1 is not supplied.

The outputs stage have been realized in darlington configuration with a drop typical 1.2V.

The disable circuit, switch-off the output 2 if a voltage lower than 0.8V is applied at Pin 4.

The Reset circuit checks the voltage at the output 1. If this one goes below $V_{OUT} - 0.25V$ (4.85V typ.), the comparator "a" (see Figure 1) discharges rapidly the capacitor C_e and the reset output goes at once Low. When the voltage at the out1 rises above $V_{OUT} - 0.2V$ (4.9V typ.), the voltage V_{C_e} increases linearly to 2.5V corresponding to a delay t_d following the law : $t_1 = \frac{C_e \cdot 2.5V}{10\mu A}$ (see Figure 2),

then the reset output goes high again. To avoid glitches in the reset output, the second comparator "b" has a large hysteresis (1.9V).
