**LC7816**

CMOS IC

**2-Pole 4-Position Analog Function Switch**

The LC7816 is a 2-pole 4-position analog function switch with 2 built-in CMOS analog switches (LC4966 type). A soft touch of a button enables switchover of the input signal source of an audio amplifier.

**Use :**

Function switchover of amplifier, receiver, etc. (2 poles 4 positions)

**Features :**

1. Good distortion characterisitic because of built-in analog switches of LC4966 type : Distortion 0.01% max./  $V_i=1V_{rms}$ ,  $V_{DD}-V_{EE}=15$  to  $37V$ .
2. Capable of outputting audio muting control signal to minimize noise to be generated at the time of switchover.
3. Built-in controller for tape monitor switchover (using LC4966 together).
4. Built-in driver for LED which displays function mode, tape monitor mode.
5. Since control input can be operated from + supply alone when using dual supplies (+, -), interface with other circuits can be achieved easily.
6. Since audio muting control signal can be triggered independently from external pin (MUTEin), audio muting at the time of return from backup can be achieved easily.
7. Control input pin (RESET) to be used for turning OFF all analog switches.
8. Backup can be performed easily because of CMOS structure. (Backup voltage: 3V min.)
9. Operating voltage :  $\pm 18V$ /dual supplies.
10. Package : DIP-28S (Shrink type).

**Pin Assignment**

Case Outline 3063-D28SNIC  
(unit:mm)
